

SME Loan Pre-Screen: Right-First-Time Applications

Name- ADITYA RAJ BORAH
Roll no- DT.61
Uni Name- ASSAM
DOWNTOWN UNIVERSITY

A Full-Stack Solution to Enhance Application Integrity and Processing Efficiency in Banking Operations

🎯 CORE OBJECTIVES

1

Achieve "Right-First-Time" (RFT) Submissions

Implement guided workflows to ensure 100% compliant document upload at the point of entry.

2

Optimize Branch-Time (OBT)

Reduce manual triage during loan screening through automated validation and structured storage.

🔧 TECHNOLOGY STACK

SYSTEM FEATURES

Multer File Upload

JSON Persistence

OTP Security

v1.0.0 Release

Dec 2025

The Challenge: The Cost of Incomplete Applications

PAIN POINT 1: Partial Submissions

Applicants frequently miss required documents (KYC, Income, Business Proof) or submit non-compliant files (wrong format/size).

🚩 NEGATIVE BUSINESS IMPACT

High Application Bounce Rate and lengthy follow-up cycles.

Delays credit underwriting and frustrates qualified applicants.

PAIN POINT 2: Manual Triage

Bank employees waste excessive time: Chasing missing files, manually checking document compliance, and filtering out duplicate or ineligible applications.

🎯 SOLUTION FOCUS

Implement Automated Guardrails at point of entry.

Ensure applications are complete and compliant from the outset.

Architecture Overview: Robust Three-Tier Design

Frontend Flow: The Guided RFT Journey

MANDATORY SUBMISSION SEQUENCE

INCOME PROOF

P&L, Bank Statements

KYC DOCUMENTS

PAN, Aadhar, Photo

BUSINESS PROOF

Registration, GST

Central Router Logic

`final-details.html` acts as the traffic controller. It dynamically queries the API to determine the applicant's current state.

WORKFLOW LOGIC

- ✓ Checks status of all 3 sections via API.
- ✓ Identifies the **NEXT** missing document.
- ✓ "Proceed" button **auto-redirects** to that specific page.

Completion Status

The application is locked and marked as complete only when all mandatory documents pass validation.

SYSTEM FLAG

"Ready for Appraisal"

Sequence Enforced

No Skipping

Backend Architecture: Express API & Security

Server & Routing

server.js • applicantRoutes.js

Routes all application logic through the `/api/applicants` base path.

✔ Multer Middleware for unified uploads

Controller Logic

applicantController.js

The Business Logic Engine handling authentication, duplicate checks, and data manipulation.

✔ Uses `fs.promises` for JSON I/O

Code Integrity

MVC Pattern

Clear separation of Routes, Controllers, and Data Models ensures maintainability and scalability.

✔ Ready for database migration

The Core Endpoint

KEY MECHANISM

Unified processing for all document submissions.

POST `/api/applicants/:id/submit-doc`

- 1 Accepts 17 Document Types (P&L, PAN, GST, etc.)
- 2 Validates Applicant ID existence
- 3 Routes file to Isolated Storage Folder
- 4 Updates JSON record with timestamp & path

```
router.post('/:id/submit-doc', upload.single('file'), async (req, res) => {  
  // Dynamic handling of any document type  
  const { id } = req.params;  
  const docType = req.body.type;  
  await controller.handleSubmit(id, docType, req.file);  
});
```

Backend Flowchart: Logic & Data Integrity

STEP	ENDPOINT / COMPONENT	LOGIC & ACTION	DATA INTERACTION
	POST <code>/validate-new</code> Applicant Registration	Duplicate Validation Reads <code>newapplicant.json</code> & <code>applicants.json</code> . Performs case-insensitive check on Company Name & Phone Number.	 <code>readJsonSafe</code> (Read)
	POST <code>/:id/submit-doc</code> Document Upload	Multer Middleware Dynamically creates isolated folder <code>/uploads/:applicantId/</code> . Saves compliant file with timestamped name.	 <code>FS Write</code> (New File)
	FUNC <code>updateApplicantDocs</code> Controller Action	Record Synchronization Updates the specific document path (e.g., <code>p1_yr1</code>) in the applicant's record within the JSON store.	 <code>writeJsonSafe</code> (Write)
	GET <code>/:id/download/:file</code> Employee Access	Secure Retrieval Validates file path exists within the applicant's isolated folder before serving via <code>res.download()</code> .	 <code>FS Read</code> (Secure)

RFT Feature Deep Dive: Validation Strategy

01

Pre-Registration Security

Identity Verification

MECHANISM

Applicant must verify a **Time-Bound OTP** before a record is initialized in the system.

IMPACT

- ✓ Establishes Verified Identity and contact info, reducing inaccurate or spam applications.

02

Client-Side Validation

RFT Core Logic

MECHANISM

JavaScript logic intercepts upload events to validate MIME type and byte size on the **client machine**.

COMPLIANCE ENFORCED

- 📄 PDF Format Only
- 📁 Maximum 5 MB

03

Duplicate Prevention

Data Integrity

MECHANISM

Controller performs explicit checks against both current (`newapplicant.json`) and historical application lists.

IMPACT

- 🚫 Eliminates processing of redundant applications, saving valuable OBT (Operating Branch Time).

OBT Feature: Isolated Document Storage

The Challenge

Storing thousands of unorganized documents in a single folder leads to filename collisions, security risks, and slow retrieval times.

The Solution: Dynamic Isolation

The **Multer** middleware is configured to dynamically create a unique directory for each applicant ID upon their first upload.

EXAMPLE GENERATED PATH

```
/backend/uploads/SMESERV1/1765012363912-pl_yr1.pdf
```

SERVER FILE SYSTEM STRUCTURE

Infinite Scalability

Supports unlimited applicants without main directory clutter or performance degradation.

Granular Security

Documents are accessed only via controlled backend routes validating the folder ID.

Easy Maintenance

Simplifies backups and data migration by keeping related files logically grouped.

OBT Feature: Employee Workflow Optimization

1

Secure Access & Triage

Staff authenticates via secure login to access the centralized Dashboard.

- ✓ employee-login.html
- ✓ Dashboard Quick-Link

2

Detail Review

Detailed view of applicant data with status flags parsed directly from JSON.

- ✓ newapplicantdetail.html
- ✓ Status Flags Visible

3

Secure Downloads

Instant access to documents via backend routing without manual searching.

- ✓ GET /:id/download/:file
- ✓ Direct Browser View

Impact Analysis

Optimized Branch Time (OBT) significantly improved by reducing manual triage steps.

Conclusion & Project Impact

RFT Achievement

Right-First-Time Goal

100%

OBT Achievement

Optimized Branch-Time

↓ PROCESSING TIME

Security & Integrity

Data Protection Measures

Established a high standard of data accuracy at the source through automated checks.

OTP Verification

Ensures verified identity before submission.

Duplicate Checks

Prevents redundant application processing.

Final Product

Capstone Delivery

A complete, full-stack SME Pre-Screening solution ready for scaling to a production environment.

Node.js/Express

Modular Arch

Secure Routes

Scalable I/O

Future Scope & Enhancements

01

Database Migration

SCALABILITY

Transition from JSON persistence to **MongoDB** or **PostgreSQL** to enable ACID compliance, concurrent access, and high availability.

02

Enhanced Security

HARDENING

Implement **Server-Side Validation** using Multer filters to enforce strict PDF file signatures and size limits before storage.

03

Automated Logic

OCR & AI

Integrate **OCR services** to auto-extract financial data (Turnover, P&L) for instant eligibility checks and conditional approval.
